

Luna Metal Planters

Product and Care Information

A Ferro zinc container is of the best quality available in the market. Years of experience have led to a range of coloured galvanised planters that will suit the contemporary patio, garden or indoor living space.

Ferro zinc containers are frost resistant when drained properly. We recommend to fill the bottom of the planter with bricks, stones, gravel or similar to form the base for good potting compost to ensure optimal drainage.

Ensure the drainage hole does not get blocked, this is best achieved by placing the pot off the ground.

If used indoors, the product must be sealed or placed in a saucer and raised off the floor to prevent condensation.

Steel products are subject to corrosion, to help prolong the life of the planter, the inside can be painted with a strong paint such as hammerite.

In time UV and weather influences will slowly change the appearance of the product in a natural way. To clean or revive we recommend you use warm soapy water or linseed oil or baby oil.
